

---

## UNIX BASICS

---

This exercise is designed to provide the basic skills required for working in the UNIX environment, using plenty of relevant examples, specifically for biologists. If you are using your personal computer, make sure that you have downloaded the files required for the workshop. This exercise will provide you information regarding navigation, files and directory creation/modification and some administrative things related to file permissions.

---

### NAVIGATION

---

This section will introduce you to some basic file/directory navigation and manipulation techniques.

---

### CHANGING DIRECTORIES

---

To jump from one directory to another we use the `cd` (change directory) command.

```
cd ..
```

Changes your present location to the parent directory

```
cd DIRECTORY
```

This changes your location back to your **DIRECTORY**.

**Task 1.1:** Now change your directory to the `WORKSHOP_FILES` directory present in your home directory.

**NOTE:** You can type in first few letters of the directory name and then press `tab` to auto complete rest of the name (especially useful when the file/directory name is long). This only works when there are unique matches for the starting letters you have typed. If there is more than one matching files/directories, pressing `tab` twice will list all the matching names. You can also recall your previous commands by pressing `up/down arrow` or browse all your previously used commands by typing `history` on your terminal (typically, last 500 commands will be saved in this file).

---

### TO KNOW THE PRESENT LOCATION OF YOUR COMMAND

---

```
pwd
```

```
/home/username
```

Returns you the present working directory (print working directory)

This means, you are now working in the `username` directory, which is located in `home` directory. The directory that you will be in after logging in is your home directory. You can also avoid writing the full path by using `~` in front of your `username` or simply `~`.

`~` or `~username`      same as `/home/username`

Present directory is represented as `.` (dot) and parent directory is represented as `..` (dot dot)

---

### VIEWING THE CONTENTS OF THE DIRECTORY

---

The contents of a directory can be viewed using `ls` (*list*) command.

`ls` **DIRECTORY**                      # now try it with `tutorials` directory

If no directory name is provided then `ls` will list all the contents of the present directory.

Like any other command, you can use absolute path or abbreviated path. There are also various options available for `ls` command.

Some very useful options include:

`ls -l`

Lists all the files in lengthy or detailed view

`ls -t`

Lists all the files, sorted based on creation time

`ls -S`

Lists all the files, sorted based on size

You can also combine these options together for getting more focused results.

*Looking at the manual for `ls`, what option can you use to view hidden files in a directory (files starting with dot)?* \_\_\_\_\_

*Can you sort the files based on its extension? How?* \_\_\_\_\_

**Task 1.5: Examine the contents of the `tutorials` directory. Try options such as `-l`, `-t`, `-a` and `-X`. Also check if you can combine many options together (like `-la` or `-lh` etc). Try these:**

`ls -l tutorials`

`ls -a`

---

### DIRECTORIES AND FILES

---

---

#### COPYING DIRECTORIES

---

To copy a file, `cp` (*copy*) command is used. When using this command you have to provide both source file and destination file.

`cp` **SOURCE DESTINATION**

You can also specify the absolute path of the source and/or destination file. To know more about any command you can use `man` command, which opens the manual of the command you ask (referred as 'man page').

man cp

This opens the manual for the `cp` command. Take a look at the manual of `cp` command (use arrow keys to move top or bottom of the page). `OPTIONS` are optional arguments that can be used to accomplish more from the same command. *Eg.*, by using option `-i` with the regular `cp` command, you can always make sure that you are not overwriting the existing file while copying. The syntax for using the options will also be provided in the manual. To exit, press q.

*Looking at the man page for cp command, what options can be used to copy a directory (including all files within it)?* \_\_\_\_\_

*How else you can get help on cp command (other than 'man')?* \_\_\_\_\_

**Task 1.3: Now change your directory back to the home directory. Create a copy of `WORKSHOP_FILES` and name it as `BACKUP_WORKSHOP`.** This will serve as a backup copy of all files that are required for the workshop (in case you accidentally modify the contents while working).

```
cp -r WORKSHOP_FILES BACKUP_WORKSHOP
```

---

### MOVING DIRECTORIES

---

To move a file or a directory, `mv` (*move*) command is used. Again, like the `cp` command you need to provide both source file and destination file.

`mv` **SOURCE DESTINATION**

Absolute path also works fine. Some of the options used by `cp` command also work with `mv` command. `mv` can also be used to rename files and directories

`mv` **OLDNAME NEWNAME**

**Task 1.4: Rename `WORKSHOP_FILES` as `tutorials`.**

```
mv WORKSHOP_FILES tutorials
```

```
ls -l tutorials
ls -lh tutorials
ls -t tutorials
```

---

### MAKING DIRECTORIES

---

To create a directory, `mkdir` (*make directory*) can be used.

`mkdir` **DIRECTORY**

Unlike PC/Mac folders, here you can't have space in your directory name (but some special characters are okay). You can also specify the path where you want to create your new folder.

**Task 1.2: Make a new directory named `FirstDirectory` within the `WORKSHOP_FILES` directory. Then change your directory to the `FirstDirectory`.**

```
mkdir FirstDirectory
```

---

### DELETING FILES AND DIRECTORIES

---

To delete directories from the system, you can use `rmdir` (*re*m*ove* d*irectory*) command. You can also use `rm` command to delete file(s).

```
rmdir DIRECTORY
```

The directory should be empty before you use the `rmdir` command.

```
rm FILE
```

To delete a file `rm` command can be used

Some useful options include

- `-r` recursively delete files
- `-f` delete forcefully

```
rm -rf DIRECTORY [DO NOT USE THIS NOW!]
```

When you want to delete a folder, with all its content

**Task 1.8:** Delete the directory named `delete_me` inside the `tutorials` directory (to do this you may first want to delete the `sample.txt` file inside this directory).

```
cd delete_me
rm sample.txt
cd ..
rmdir delete_me
```

---

### CREATING AND EDITING FILES

---

```
touch FILENAME
```

Creates a new file in the present location

```
nano FILENAME
```

Like notepad/textedit, this text editor lets you edit a file.

**Task 1.6:** Create a new file named `firstfile` inside the `tutorials` directory. You can create using `touch` or using `nano`. Then add some contents (Your name and email address) to the `firstfile` (using `nano`). After editing, press `Ctrl + X` to exit, then enter `y` to save changes and confirm the file name.

```
touch firstfile
nano firstfile
```

---

VIEWING CONTENTS OF THE FILES

---

There are various commands to print the contents of the file in bash. Most of these commands are often used in specific contexts. All these commands when executed with filenames displays the contents on the screen. Most common ones are `less`, `more`, `cat`, `head` and `tail`.

`less FILENAME` *try this: less AT\_cDNA.fa*

Displays file contents on the screen with line scrolling (to scroll you can use `arrow` keys, `PgUp/PgDn` keys, `space bar` or `Enter` key). **When you are done press q to exit.**

`more FILENAME` *try this: more AT\_cDNA.fa*

Like less command, also, displays file contents on the screen with line scrolling but uses only `space bar` or `Enter` key to scroll. **When you are done press q to exit.**

`cat FILENAME` *try this: cat AT\_cDNA.fa*

Simplest form of displaying contents. It *catalogs* the entire contents of the file on the screen. In case of large files, entire file will scroll on the screen without pausing

`head FILENAME` *try this: head AT\_cDNA.fa*

Displays only the starting lines of a file. The default is first ten lines. But, any number of lines can be displayed using `-n` option (followed by required number of lines).

`tail FILENAME` *try this: tail AT\_cDNA.fa*

Similar to head, but displays the last 10 lines. Again `-n` option can be used to change this.

More information about any of these commands can be found in `man` pages (`man` command)

**Task 1.7: Try using all these commands on the `RefSeq.faa`. You are also welcome to try these commands on various other files that are present in the `tutorials` directory.** These commands don't change the contents of the file; they just display them on the screen.

---

COMPRESSING FILES

---

There are several options for archiving and compressing groups of files or directories. Compressed files are not only easier to handle (copy/move) but also occupy less size on the disk (less than 1/3 of the original size). In Linux systems you can use `zip`, `tar` or `gz` for archiving and compressing files/directories.

ZIP compression/extraction

`zip OUTFILE.zip INFILE.txt`  
Compress `INFILE.txt`

`zip -r OUTDIR.zip DIRECTORY`  
Compress all files in a `DIRECTORY` into one archive file (`OUTDIR.zip`)

`zip -r OUTFILE.zip . -i *.txt`

Compress all txt files in a `DIRECTORY` into one archive file (`OUTFILE.zip`)

```
unzip SOMEFILE.zip
```

Decompress a file

**Task 1.9: Zip `AT_genes.gff` file located in the `tutorials` directory. Check the file size before and after zip compression (Hint: use `ls -lh` to check file sizes).**

```
zip AT_genes.gff.zip AT_genes.gff
```

*Is there any size difference before and after compressing?*

Y/N

`tar` (tape archive) utility saves many files together into a single archive file, and restores individual files from the archive. It also includes automatic archive compression/decompression options and special features for incremental and full backups.

```
tar -cvf OUTFILE.tar INFILE
```

archive INFILE

```
tar -czvf OUTFILE.tar.gz INFILE
```

archive and compress file INFILE

```
tar -tvf SOMEFILE.tar
```

list contents of archive SOMEFILE.tar

```
tar -xvf SOMEFILE.tar
```

extract contents of SOMEFILE.tar

```
tar -xzvf SOMEFILE.tar.gz
```

extract contents of gzipped archive SOMEFILE.tar.gz

```
tar -czvf OUTFILE.tar.gz DIRECTORY
```

archive and compress all files in a directory into one archive file

```
tar -czvf OUTFILE.tar.gz *.txt
```

archive and compress all ".txt" files in current directory into one archive file

**Task 1.10: Archive and compress the `BACKUP_WORKSHOP` directory you created in Task 1.3 (you can name it as `backup.tar.gz` or anything you want)**

```
tar -czvf backup.tar.gz BACKUP_WORKSHOP
```

`gzip` (gnu zip) compression utility designed as a replacement for `compress`, with much better compression and no patented algorithms. The standard compression system for all GNU software.

```
gzip SOMEFILE
```

compress `SOMEFILE` (also removes uncompressed file)

```
gunzip SOMEFILE.gz
```

uncompress `SOMEFILE.gz` (also removes compressed file)

**Task 1.11:** `gzip` the file `AT_genes.gff` and examine the size. `gunzip` it back so that you can use this file for the later exercises.

```
gzip AT_genes.gff
ls -lh
gunzip AT_genes.gff.gz
ls -lh
```

---

## PIPES AND REDIRECTS

---

Many `UNIX` commands use some input file/data and display the output on the screen. This is feasible when the data being displayed is small enough to fit the screen or if it is the endpoint of your analysis. But for large data outputs, it is efficient to redirect to a file instead of screen. This can be done very easily in `UNIX` using `>` (greater than) or `<` (lesser than) or `>>` signs.

- `<` redirects the data to the command for processing
- `>` redirects the data from the command's output to a file. The file will be created if it is non-existing and if present it will overwrite the contents with the new output data (you will lose the original file).
- `>>` unlike `>` this redirection lets user append the data to an already existing file or a new file
- Another special operator `|` (called pipe) is used sometimes to pass the output from a command to another command (as input) before sending it to an output file or display.

Some *eg.*

```
cat FILE1 > FILE2
```

Creates a new file, `FILE2` with same contents as old file, `FILE1`

```
cat FILE1 >> FILE2
```

Appends the contents for `FILE1` to `FILE2`, equivalent to opening `FILE1`, copying all the contents, pasting the copied contents to the end of the `FILE2` and saving it!

```
cat FILE1 | less
```

Here, `cat` command displays the contents of the `FILE1`, but instead of sending it to standard output (screen) it sends it through the pipe to the next command 'less' so that contents of the file are now displayed on the screen with line scrolling.

**Task 2.1:** The `Sequences` directory contains a number of files and each of these files contain a single `FASTA` formatted nucleotide sequence. Combine them all together to make a single file `sequences.fasta` using redirects.

```
cat *.fa >> sequences.fasta
```

this command will combine all `.fa` files into one.

---

## REGULAR EXPRESSIONS

---

When working with the sequences (protein or DNA) we are often interested to see if a particular feature is present or not. This could be various things like a start codon, restriction site or even a

---

motif. In **UNIX** all strings of text that follow some pattern can be searched using some formula called regular expressions. *eg.* If you are looking for a particular motif in large number of sequences, then you can create a regular expression in **UNIX** and search all the sequences having that motif relatively easily. Regular expression consists of normal and metacharacters. Commonly used characters include

Expression	Function
.	matches any single character
\$	matches the end of a line
^	matches the beginning of a line
*	matches zero or more character
\	quoting character, treat the next character followed by this as an ordinary character.
[ ]	matches one or more characters between the brackets
?	match 1 occurrence of the character

For complete list, type **info regex** on your terminal.

## ADMINISTRATIVE COMMANDS

### CHANGING PERMISSIONS

All files in the UNIX system will have a set of permissions which define what can be done with that file and by whom. (What = read (view contents), write (modify) and execute (run script) Whom=User (owner), group (that account belongs to) and everyone else). They are denoted as

#### PERMISSIONS

read        r  
write       w  
execute     x

#### RELATIONS

owner       u  
group       g  
others      o  
all users   a

To look at the permissions for any file, you can list the files with **l** option (**ls -l**).

```
Permissions User  Group Size  Date modified  Name
lrwxrwxrwx 1 arnstrm GIF    24 Jan  7 09:40 arnstrm -> /data006c/GIF_2c/arnstrm
drwxrwx--- 3 arnstrm GIF   4096 Jun  4 15:27 bin
drwxrwxr-x 5 arnstrm GIF   4096 Mar 18 09:10 coreutils
-rwxr-xr-x 1 arnstrm GIF  11908 Jan  7 13:07 cshrc_severin
drwxrwxr-x 4 arnstrm GIF   4096 Mar 18 09:17 dos2unix
-rw-rw-r-- 1 arnstrm GIF  46470 May 19 09:48 gtf2gff3.pl
drwxrwxr-x 4 arnstrm GIF   4096 Apr 10 09:15 igv
-rw-rw-r-- 1 arnstrm GIF    930 May 16 11:05 module_file.txt
-rwxrwx--- 1 arnstrm GIF   1228 Jun  5 14:51 template.sub
-rw-rw-r-- 1 arnstrm GIF  11326 May 19 09:47 validate_features.pl
```

u   g   o

(d=directory, l=link, r=read, w=write, x=execute, -=blank, u=user, g=group, o=others)

To set/modify a file's permissions you need to use the `chmod` command (change mode). Only the owner of a file can alter a file's permissions. The syntax:

```
chmod [OPTIONS] RELATIONS[+ or -]PERMISSIONS FILE
```

Add permissions

```
chmod RELATIONS+PERMISSIONS FILENAME
```

```
chmod g+rwx FILENAME          grants read, write and execute permissions for group
```

```
chmod g+r FILENAME            grants read permission for group
```

```
chmod a+rwx FILENAME          makes the file public (don't do this to any file/directory unless  
                              you want to share)
```

Remove permissions

```
chmod RELATIONS-PERMISSIONS FILENAME
```

```
chmod g-wx FILENAME           removes write and execute permissions for group
```

```
chmod g-rwx FILENAME          removes all permissions for group
```

```
chmod a-rwx FILENAME          removes all permissions for others
```

```
chmod a-x FILENAME            removes execution permissions for others
```

OPTIONS include

```
-R          recursively (the permissions are applied to all the files, directories present inside the  
            directory)
```

**Task 1.12: Check the permissions for the files located in the `tutorials` directory. Do**

```
ls -l
```

*What permissions does the group have on these files?*

---

*Which group does your account belong to?*

---

---

### TR

---

The `tr` (translate) utility in UNIX can translate or transliterate the input to produce a modified output. It uses 2 sets of parameters, and replaces occurrences of the characters in the first set with the corresponding elements from the other set.

```
tr [OPTIONS] "STRING1" "STRING2" <INFILE >OUTFILE
```

Useful options are

```
-c          complements the set of characters specified by string1
```

```
-d          delete occurrences of string1 (string2 not needed)
```

```
-s          squeeze repeats or multiple occurrences found in string1 will be replaced with one  
            string2
```

Common uses of `tr` command are:

```
tr "a-z" "A-Z"          or          tr "[:lower:]" "[:upper:]"
```

Convert lower case to upper case (or upper to lower case)

```
tr -s '\n'
```

Convert each sequence of repeated newlines to a single newline

Files generated in both Mac and Windows OS will have a different **newline** character (to mark the end of the line) that is not recognized by the UNIX OS. Similarly files generated in UNIX will have a different newline that can't be read in Windows or Mac OS. The 'tr' command provides an easy way to convert these 'newlines' to different forms.

```
tr '\r' '\n' <MAC.TXT >UNIX.TXT
```

Convert Mac text file to UNIX text file

```
tr '\n' '\r' <UNIX.txt >MAC.TXT
```

Convert UNIX text file to MAC text file

```
tr -d '\015' <WIN.TXT >UNIX.TXT
```

Convert Windows text file to UNIX text file

```
tr '\n' '\015' <UNIX.txt >WIN.TXT
```

Convert UNIX text file to windows text file

NOTE: There are in built commands like **dos2unix**, **mac2unix** and **unix2dos** to do these conversions automatically in most recent versions of **UNIX**.

There are several utilities that can mask low complexity regions of the genomes such as repeats. They do that either by converting the bases/residues to lower case (soft masking) or converting them to N or X (hard masking). The public databases often store these soft masked genomes. When downloaded it might be useful to remove the masking, if your analysis doesn't require it (pattern searching etc.). It can be easily done by changes cases

```
tr "ATGC" "atgc" <AT_cDNA.fa >AT_cDNA_tr.fa
```

Converts masking from the sequences and saves them in a new file

```
tr "ATGC" "AUGC" <AT_cDNA.fa > AT_rna.fa
```

Converts cDNA to mRNA sequence and saves them in a new file

---

## WORD COUNT

---

**wc** (word count) is another useful command that lets you count the number of words (and lines) in a file

```
wc FILENAME try this wc AT_genes.gff
```

This outputs both number of words as well as lines in a file.

```
wc -l FILENAME try this wc -l AT_genes.gff
```

Outputs only number of lines in file

Often these commands are "piped" with other commands to count certain things. *eg.*: Counting the number of files in a directory, counting the number of sequences etc.

**Task 2.6: Count how many files with .fa extensions are present in sequences directory.**

```
ls Sequences | wc -l
```

---

### SORT

---

`sort` command can be used to arrange things in a file. Simplest way to use this command is:

```
sort FILE1 > SORTED_FILE1
```

Useful options include

- n numerical sort
- r reverse sort
- k N,N sort the N<sup>th</sup> field (column), where N is a number. Sorting can also be done on the exact character on a particular field *eg.* -k 4.3,4.4 sorts based on 3<sup>rd</sup> and 4<sup>th</sup> character of the 4<sup>th</sup> field. Additionally you can supply additional -k for resolving ties.
- t specify the delimiters to be used to identify fields (default is TAB) *eg.* -t : to use ':' as delimiter

**Task 2.7: The Sequences directory consists of numerically labeled files. UNIX can sort either alphabetically or numerically (not both) and hence they are arranged in NT1.fa, NT10.fa, NT11.fa etc. In order to sort them in an easy to read way, try using**

```
ls | sort -n -k 1.3,1.4
```

This command lists all the files in sequences directory and then passes it to sort command. Sort command then sorts it numerically but only using 3<sup>rd</sup> and 4<sup>th</sup> letters of the first field (file name)

Try using sort on AT\_genes.gff file

```
sort -r -k 1,1 AT_genes.gff
sort -r -k 4,4 AT_genes.gff
```

---

### UNIQ

---

`uniq` (*unique*) command removes duplicate lines from a sorted file, retaining only one instance of the running matching lines. Optionally, it can show only lines that appear exactly once, or lines that appear more than once. `uniq` requires sorted input since it compares only consecutive lines.

```
uniq [OPTIONS] INFILE OUTFILE
```

Useful options include

- c count; prints lines by the number of occurrences
- d only print duplicate lines
- u only print unique lines
- i ignore differences in case when comparing
- s N skip comparing the first N characters (N=number)

**Task 2.8: Number each lines based on number of occurrences:**

```
uniq -c ids.txt
```

**Print only duplicated lines.**

```
uniq -d ids.txt
```

**Print only unique lines.**

```
uniq -u ids.txt
```

---

## COMPARING FILES

---

`diff` (*difference*) reports differences between files. A simple example for `diff` usage would be

```
diff [OPTIONS] FILE1 FILE2
```

Useful options include

- b ignore blanks
- w ignore white space (spaces and tabs)
- i ignore case
- r recursively compare all files (when comparing folders)
- s list all similar files (when comparing folders)
- y side by side comparison of files

The differences reported will be in the form of corrections that are required to change the first file to second file

Generate `diffIDs.txt` by comparing the differences between `ids_a.txt` and `ids_b.txt`

```
diff -y ids_a.txt ids_b.txt > diffIDs.txt
```

*Are these files different?*

`comm` (*common*) command compares two sorted files line by line.

```
comm [OPTIONS] FILE1 FILE2
```

- 1 suppress lines unique to FILE1
- 2 suppress lines unique to FILE2
- 3 suppress lines that appear in both files

**Task 2.9: Compare the same files (`ids_a.txt` and `ids_b.txt`) again with '`comm`' command and see how the outputs differ**

```
comm -1 ids_a.txt ids_b.txt
comm -2 ids_a.txt ids_b.txt
comm -3 ids_a.txt ids_b.txt
```

---

DIVIDING FILES

---

`cut` divides the file into several parts and displays selected columns or fields from each line of a file. Normally `cut` command requires how the fields are separated and what fields need to be displayed.

```
cut -d "," -f 2-4 FILE           displays columns 2,3 and 4 of a file separated by ","
cut -d "|" -f 1,10 FILE          displays 1st and 10th columns of a file separated by "|"
cut -f 1 FILE                    displays 1st column of a file, assumes TAB as delimiter
```

`split` generates output files of a fixed size (bytes or lines). Useful when huge file needs to be processed. eg.,

```
split -d -l 100 FILENAME SUFFIX
```

here `-d` specifies numeric suffix only (suffix00, suffix01, suffix02 etc.) while `-l` specifies number of lines in each file (100 in this case). If you want to split based on bytes, you can use `-b` option (eg. `-b 1k` or `-b 1m` for 1 KB and 1 MB respectively)

*From the commands that you have learned, can you combine all the split files into a single file again?*

**Task 2.10: Display only first column of the `AT_genes.gff` file using `cut`**

```
cut -f 1 AT_genes.gff           (press ctrl + c to exit) or
cut -f 1 AT_genes.gff | less
```

**Similarly, display 1<sup>st</sup>, 4<sup>th</sup> and 5<sup>th</sup> column of the `AT_genes.gff` file**

```
cut -f 1,4,5 AT_genes.gff       (press ctrl + c to exit) or
cut -f 1,4,5 AT_genes.gff | less
```

**Verify if all the columns in `AT_genes.gff` file has same number of entries in every field**

```
cut -f 1 AT_genes.gff | wc -l
cut -f 2 AT_genes.gff | wc -l
cut -f 3 AT_genes.gff | wc -l
```

**Split the file `AT_genes.gff` every 100,000 lines. Use `gff_split` as suffix for the files and use numerical suffix.**

```
split -d -l 100000 AT_genes.gff gff_split
```

*How many split files are generated:* \_\_\_\_\_

```
ls gff_split* | wc -l
```

---

COMBINING FILES

---

`paste` prints lines consisting of sequentially corresponding lines of each specified file. eg.,

```
paste FILE1 FILE2 > FILE3
```

Combines the contents of `FILE1` and `FILE2`, side by side generating a new file, `FILE3`.

**Task 2.11: Combine columns of `ids_a.txt` and `ids_b.txt` files.**

```
paste ids_a.txt ids_b.txt
```

How many columns do you see after combining? \_\_\_\_\_

`join` combines two files based on the common field that is specified

```
join -t':' -1 N -2 N FILE1 FILE2
```

`-t ':'` Specify field separator (here ":" but you can specify anything. Default is TAB)

`-1 N` Common field number (N) from the 1<sup>st</sup> file

`-2 N` Common field number (N) from the 2<sup>nd</sup> file

**Task 2.12: Join columns based on column 1 in `genes_a.gff` and column 3 in `genes_b.gff`**

```
join -1 1 -2 3 genes_a.gff genes_b.gff
```

---

## DOWNLOADING DATA

---

In order to start using the computational power of the HPC cluster, you need to first get the data there. If your data is already in your local computer, you can transfer them easily using WinSCP software or any other software (refer prerequisites). But if the data that you will be using is available in the public databases then you can directly get it from there using `curl` or `wget` command (WWW get)

To download data from NCBI Sequence Read Archive (SRA) or genomics core website or any other website:

```
curl -O http://website.url
```

If using `wget` then,

```
wget http://website.url
```

As an example, we will download *Glycine max* (soy bean) annotation information file from Phytozome DB.

```
curl -O http://goo.gl/CDXx15
```

This is a single line command and you will see '`Gmax_189_annotation_info.txt.gz`' file after few seconds. You can extract it and view it or delete it using the commands you have learnt.

## QUICK REFERENCE SHEET

### COMMANDS USED IN THIS MANUAL

Command	Function	Syntax/example usage
<i>Navigation</i>		
ls	list contents	ls [OPTIONS] DIRECTORY
pwd	print working directory	pwd
cd	change directory	cd ~ or cd #home directory cd .. #previous (parent directory)
<i>File/Directory operations</i>		
mkdir	make directory	mkdir DIRECTORY
cp	copy files/directories	cp SOURCE DESTINATION
man	manual page (help)	man COMMAND
mv	move files/directories	mv SOURCE DESTINATION
touch	create file	touch FILE
nano	edit file	nano FILE
less	view file (with more options)	less FILE
more	view file (with less options)	more FILE
cat	catalog file contents	cat FILE
head	show first few lines of a file	head FILE
tail	show last few lines of a file	tail FILE
rmdir	remove empty directory	rmdir DIRECTORY
rm	remove file(s)	rm FILE
<i>Compression/archiving</i>		
zip	zip compress	zip OUTFILE.zip INFILE.txt zip -r OUTDIR.zip DIRECTORY
unzip	decompress zipped file	unzip ANYTHING.zip
tar	archive and compress files/directories	tar -czvf OUTFILE.tar.gz DIRECTORY #compress tar -xzvf OUTFILE.tar.gz #extract
gzip	gzip files	gzip SOMEFILE
gunzip	decompress gzipped files	gunzip SOMEFILE.gz
<i>File permissions</i>		
chmod	change permissions for files/directories	chmod [OPTIONS] RELATIONS[+/-]PERMISSIONS FILE
<i>File manipulations</i>		
grep	search a pattern	grep [OPTIONS] "PATTERN" FILENAME
sed	stream edit a file	sed 's/search/replace/g' FILENAME
awk	multi-purpose command	awk 'PATTERN {ACTION}' FILENAME
tr	translate or transliterate a file	tr [OPTIONS] "STRING1" "STRING2" <INFILE
wc	word count	wc FILENAME
sort	sort files	sort FILE1 > SORTED_FILE1
uniq	display unique lines	uniq [OPTIONS] INFILE > OUTFILE
diff	display difference	diff [OPTIONS] FILE1 FILE2
comm	display common lines among files	comm [OPTIONS] FILE1 FILE2
cut	break files vertically based on fields	cut -d "DELIMITER" -f NUMBER FILE
split	break files horizontally	split [OPTIONS] FILENAME
paste	combine files side by side	paste FILE1 FILE2 > FILE3
join	join files based on common field	join -t'DELIMITER' -1 N -2 N FILE1 FILE2

### ADDITIONAL COMMANDS

Command	Function
du -sh <b>DIR</b>	show directory size
whoami	display username
date	system date/time
cal	calendar
find . -name <b>FILE</b>	find a file/directory
which <b>CMD</b>	display default cmd path
whereis <b>CMD</b>	show possible locations of cmd
locate <b>FILE</b>	find instances of a file
clear	clear screen
sleep <b>5</b>	pause 5 (any) seconds
top	current running processes
ps	current running processes
wget <b>URL</b>	download specified URL

### NANO SHORTCUTS

Commands	Function
ctrl+r	read/insert file
ctrl+o	save file
ctrl+x	close file
alt+a	start selecting text
ctrl+k	cut selection
ctrl+u	uncut (paste) selection
alt+/	go to end of the file
ctrl+a	go to start of the line
ctrl+e	go to end of the line
ctrl+c	show line number
ctrl+_	go to line number
ctrl+w	find matching word
alt+w	find next match
ctrl+\	find and replace

### PRE-DECLARED VARIABLES

Variables*	Description
\$USER	username
\$HOME	home path
\$PWD	working directory path
\$PATH	path for executables
\$HOSTNAME	machine name
\$SHELL	current shell
\$SSH_CLIENT	local client's IP address
\$TERM	type of terminal

\* env command lists all the assigned variables

### SHORTCUTS

Commands	Function
TAB	autocomplete names
UP/DOWN	browse previous commands
ctrl+c	interrupt/kill anything
ctrl+l	clear screen
ctrl+d	quit, exit
ctrl+z	suspend (use fg to restore)
!!	repeat last command
alt+.	last argument of previous cmd
ctrl+insert	copy selection
shift+insert	paste copied text
ctrl+a	go to start of the line
ctrl+e	go to end of the line
ctrl+r	reverse search history
cd ~	go to home

### PIPES, REDIRECTS

Redirects	Function
cmd < file	use file as input
cmd > file	write output to file
cmd >> file	append output to file
cmd 2> stderr	error output to file
cmd 1>&2 file	send output and error to file
cmd1   cmd2	send output of cmd1 to cmd2

---

HPC-CLUSTER SPECIFIC COMMANDS

---

<b>Command</b>	<b>Function</b>	<b>Syntax/example usage</b>
qstat	lists current jobs on queues	qstat -an1 <b>queue</b> <i># current jobs in specified queue</i> qstat -u <b>username</b> <i># current jobs by the user</i> qstat -f <b>jobid</b> <i># information about the job (id#)</i> qstat -q <i># list all queues</i> qstat -a <i># list all jobs</i> qstat -r <i># list running jobs</i> qstat -Qf <b>queue</b> <i># information about the 'queue'</i>
qdel	delete job from the queue	qdel <b>jobid</b>
qsub	submit job to the queue	qsub <b>submissionfile.sub</b>
qhold	hold job in queue	qhold <b>jobid</b>
qrls	release job for running	qrls <b>jobid</b>
qnodes	details about the nodes	qnodes
module	use preinstalled programs	module load <b>PROGRAM</b> <i># loads program for use</i> module list <i># lists all loaded modules</i> module avail <i># lists available modules</i> module unload <b>PROGRAM</b> <i># unloads module</i>
